## Grade 8

For Math Grade 8, a one-credit course, instruction should focus on 3 critical areas: (1) formulating and reasoning about expressions and equations, including modeling an association in bivariate data with a linear equation, and solving linear equations and systems of linear equations; (2) grasping the concept of a function and using functions to describe quantitative relationships; and (3) analyzing two- and three-dimensional space and figures using distance, angle, similarity, and congruence, and understanding and applying the Pythagorean Theorem. Each critical area is described below.
(1) Students use linear equations and systems of linear equations to represent, analyze, and solve a variety of problems. Students recognize equations for proportions ( $y / x=m$ or $y=m x)$ as special linear equations $(y=m x+b)$, understanding that the constant of proportionality $(m)$ is the slope, and the graphs are lines through the origin. They understand that the slope $(m)$ of a line is a constant rate of change, so that if the input or $x$-coordinate changes by an amount $A$, the output or $y$-coordinate changes by the amount $m \cdot A$. Students also use a linear equation to describe the association between two quantities in bivariate data (such as arm span vs. height for students in a classroom). At this grade, fitting the model, and assessing its fit to the data are done informally. Interpreting the model in the context of the data requires students to express a relationship between the two quantities in question and to interpret components of the relationship (such as slope and $y$-intercept) in terms of the situation.

Students strategically choose and efficiently implement procedures to solve linear equations in one variable, understanding that when they use the properties of equality and the concept of logical equivalence, they maintain the solutions of the original equation. Students solve systems of two linear equations in two variables and relate the systems to pairs of lines in the plane; these intersect, are parallel, or are the same line. Students use linear equations, systems of linear equations, linear functions, and their understanding of slope of a line to analyze situations and solve problems.
(2) Students grasp the concept of a function as a rule that assigns to each input exactly one output. They understand that functions describe situations where one quantity determines another. They can translate among representations and partial representations of functions (noting that tabular and graphical representations may be partial representations), and they describe how aspects of the function are reflected in the different representations.
(3) Students use ideas about distance and angles, how they behave under translations, rotations, reflections, and dilations, and ideas about congruence and similarity to describe and analyze two-dimensional figures and to solve problems. Students show that the sum of the angles in a triangle is the angle formed by a straight line, and that various configurations of lines give rise to similar triangles because of the angles created when a transversal cuts parallel lines. Students understand the statement of the Pythagorean Theorem and its converse, and can explain why the Pythagorean Theorem holds, for example, by decomposing a square

## Grade 8 (continued)

in two different ways. They apply the Pythagorean Theorem to find distances between points on the coordinate plane, to find lengths, and to analyze polygons. Students complete their work on volume by solving problems involving cones, cylinders, and spheres.

The content of this document is centered on the mathematics domains of Counting and Cardinality (Grade K), Operations and Algebraic Thinking; Numbers and Operations in Base Ten (Grades K-5); Numbers and Operations-Fractions (Grades 3-5); Measurement and Data (Grades K-5); Ratios and Proportional Relationships (Grades 67); the Number System, Expressions \& Equations, Geometry, Statistics \& Probability (Grades 6-8); Functions (Grade 8), and the high school conceptual categories of Number and Quantity, Algebra, Functions, Modeling, Geometry, and Statistics \&
Probability. Instruction in these domains and conceptual categories should be designed to expose students to experiences, which reflect the value of mathematics, to enhance students' confidence in their ability to do mathematics, and to help students communicate and reason mathematically.

## Grade 8

## The Number System (NS)

Know that there are numbers that are not rational, and approximate them by rational numbers

| 8.NS. 1 | Know that numbers that are not rational are called irrational. Understand informally that every number has a decimal expansion; for rational numbers show that the decimal expansion repeats eventually, and convert a decimal expansion which repeats eventually into a rational number. |
| :---: | :---: |
| 8.NS. 2 | Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line diagram, and estimate the value of expressions (e.g., $\pi^{2}$ ). For example, by truncating the decimal expansion of $\sqrt{ } 2$, show that $\sqrt{ } 2$ is between 1 and 2, then between 1.4 and 1.5, and explain how to continue on to get better approximations. |
| Expressions and Equations (EE) |  |
| Work with radicals and integer exponents |  |
| 8.EE. 1 | Know and apply the properties of integer exponents to generate equivalent numerical expressions. For example, $3^{2} \times 3^{-5}=3^{-3}=1 / 3^{3}=1 / 27$. |
| 8.EE. 2 | Use square root and cube root symbols to represent solutions to equations of the form $x^{2}=p$ and $x^{3}=p$, where $p$ is a positive rational number. Evaluate square roots of small perfect squares and cube roots of small perfect cubes. Know that $\sqrt{ } 2$ is irrational. |
| 8.EE. 3 | Use numbers expressed in the form of a single digit times an integer power of 10 to estimate very large or very small quantities, and to express how many times as much one is than the other. For example, estimate the population of the United States as $3 \times 10^{8}$ and the population of the world as $7 \times 10^{9}$, and determine that the world population is more than 20 times larger. |
| 8.EE. 4 | Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology. |

Understand the connections between proportional relationships, lines, and linear equations

| 8.EE.5 | two different proportional relationships represented in different ways. For example, compare a <br> distance-time graph to a distance-time equation to determine which of two moving objects has <br> greater speed. |
| :--- | :--- |
| 8.EE.6 | Use similar triangles to explain why the slope $m$ is the same between any two distinct points on <br> a non-vertical line in the coordinate plane; derive the equation $y=m x$ for a line through the <br> origin and the equation $y=m x+b$ for a line intercepting the vertical axis at $b$. |

## Grade 8

| Analyze and solve linear equations and pairs of simultaneous linear equations |  |
| :---: | :---: |
| 8.EE. 7 | Solve linear equations in one variable. <br> a. Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x=a, a=a$, or $a=b$ results (where $a$ and $b$ are different numbers). <br> b. Solve linear equations and inequalities with rational number coefficients, including those whose solutions require expanding expressions using the distributive property and collecting like terms. |
| 8.EE. 8 | Analyze and solve pairs of simultaneous linear equations. <br> a. Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously. <br> b. Solve systems of two linear equations in two variables algebraically, and estimate solutions by graphing the equations. Solve simple cases by inspection. For example, $3 x+2 y=5$ and $3 x+2 y=6$ have no solution because $3 x+2 y$ cannot simultaneously be 5 and 6. <br> c. Solve real-world and mathematical problems leading to two linear equations in two variables. For example, given coordinates for two pairs of points, determine whether the line through the first pair of points intersects the line through the second pair. |
| Functions (F) |  |
| Define, evaluate, and compare functions |  |
| 8.F. 1 | Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output. ${ }^{1}$ |
| 8.F. 2 | Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a linear function represented by a table of values and a linear function represented by an algebraic expression, determine which function has the greater rate of change. |
| 8.F. 3 | Interpret the equation $y=m x+b$ as defining a linear function, whose graph is a straight line; give examples of functions that are not linear. For example, the function $A=s^{2}$ giving the area of a square as a function of its side length is not linear because its graph contains the points $(1,1),(2,4)$ and $(3,9)$, which are not on a straight line. |
| Use functions to model relationships between quantities |  |
| 8.F. 4 | Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two $(x, y)$ values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values. |

## Grade 8

| 8.F.5 | Describe qualitatively the functional relationship between two quantities by analyzing a graph <br> (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that <br> exhibits the qualitative features of a function that has been described verbally. |
| :--- | :--- |
| Geometry (G) (G) |  |$|$| Understand congruence and similarity using physical models, transparencies, or geometry software |  |
| :--- | :--- |
| 8.G.1 | Verify experimentally the properties of rotations, reflections, and translations <br> a. Lines are taken to lines, and line segments to line segments of the same length. <br> b. Angles are taken to angles of the same measure. <br> c. Parallel lines are taken to parallel lines. |
| 8.G.2 | Understand that a two-dimensional figure is congruent to another if the second can be obtained <br> from the first by a sequence of rotations, reflections, and translations; given two congruent <br> figures, describe a sequence that exhibits the congruence between them. |
| 8.G.3 | Describe the effect of dilations, translations, rotations, and reflections on two-dimensional <br> figures using coordinates. |
| 8.G.4 | Understand that a two-dimensional figure is similar to another if the second can be obtained <br> from the first by a sequence of rotations, reflections, translations, and dilations; given two <br> similar two-dimensional figures, describe a sequence that exhibits the similarity between them. |
| 8.G.5 | Use informal arguments to establish facts about the angle sum and exterior angle of triangles, <br> about the angles created when parallel lines are cut by a transversal, and the angle-angle <br> criterion for similarity of triangles. For example, arrange three copies of the same triangle so <br> that the sum of the three angles appears to form a line, and give an argument in terms of <br> transversals why this is so. |
| 8.G.9 Understand and apply the Pythagorean Theorem |  |

## Grade 8

| 8.SP. 2 | Know that straight lines are widely used to model relationships between two quantitative <br> variables. For scatter plots that suggest a linear association, informally fit a straight line, and <br> informally assess the model fit by judging the closeness of the data points to the line. |
| :--- | :--- |
| 8.SP.3 | Use the equation of a linear model to solve problems in the context of bivariate measurement <br> data, interpreting the slope and intercept. For example, in a linear model for a biology <br> experiment, interpret a slope of 1.5 cm/hr as meaning that an additional hour of sunlight each <br> day is associated with an additional 1.5 cm in mature plant height. |
| 8.SP.4 | Understand that patterns of association can also be seen in bivariate categorical data by <br> displaying frequencies and relative frequencies in a two-way table. Construct and interpret a <br> two-way table summarizing data on two categorical variables collected from the same subjects. <br> Use relative frequencies calculated for rows or columns to describe possible association <br> between the two variables. For example, collect data from students in your class on whether or <br> not they have a curfew on school nights and whether or not they have assigned chores at <br> home. Is there evidence that those who have a curfew also tend to have chores? |

${ }^{1}$ Function notation is not required in Grade 8.

## Additional Resource

## 2016 Mississippi College- and Career-Standards Scaffolding Document

The primary purpose of the 2016 Mississippi College- and Career-Readiness Standards Scaffolding Document is to provide teachers with a deeper understanding of the Standards as they plan for classroom instruction. Based on the 2016 Mississippi College- and CareerReadiness Standards for Mathematics, this document provides a close analysis of the requirements for student mastery. Because of the rigor and depth of the Standards, scaffolding instruction to meet the needs of all learners is essential to individual success. The Scaffolding Document will aid teachers' understanding of how to teach the Standards through a natural progression of student mastery. The Scaffolding Document can be found at http://www.mde.k12.ms.us/ESE/ccr.

Standards for Mathematical Practice

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.
